7- Retrieve all orders placed on June 6 of any year, along with the customer city, customer state.

select order_id, customer_city, customer_state, order_purchase_timestamp

from orders join customers using(customer_id)

where month(order_purchase_timestamp) = 6 and day(order_purchase_timestamp) = 6;

/* 3 rows returned */

8- Retrieve all delivered order details along with the corresponding customer ID, city, and state. Order by customer state.

select customer_id, customer_city, customer_state

from customers join orders using(customer_id)

where order_status = 'delivered';

/* 347 rows returned */

9- Retrieve products without any sellers and their sold products. List product ID and category.

select product_id, product_category_name

from products left join orderitems using(product_id)

where seller_id is null;

/* 497 rows returned */

10- Find the total revenue generated from orders placed on November 12. In the revenue calculation, consider the shipping charge and price of the product.

select sum(price + shipping_charges) /* Assuming shipping is a service provided by seller, other wise price should be reduce by shipping_charges*/

from orderitems join orders using(order_id)

where month(order_purchase_timestamp) = 11 and day(order_purchase_timestamp) = 12;

/* 1 row returned */

11- Retrieve all product orders along with their sellers and customer locations (city and state). List only the customers from the city of "Belem".

select order_id, seller_id, customer_city, customer_state

from customers join orders using(customer_id) join orderitems using (order_id)

where customer_city = 'Belem';

/* 4 rows returned */

12- Identify the top 5 most expensive products, but only if they have been purchased at least 3 times.

select max(price), product_id, count(order_id) as times_purchased

from orderitems

group by product_id

having times_purchased >= 3

order by max(price) desc

limit 5;

/* 5 rows returned */

13- Find the number of orders per purchase month. Which month has the lowest number of orders? List the purchase month and the number of orders.

select count(order_id) as num_orders, month(order_purchase_timestamp) as purchased_month

from orders

group by purchased_month

order by num_orders;

/* 12 rows returned */

14- How much time did it take for you to finish?

1 h 20 mins
